

Lighting Up Suez & Panama from Real Data (R267)

Precedence resolver for a canal chokepoint node: real PortWatch transit > real canal scrape > hardcoded baseline.

HOW IT WORKS — PRECEDENCE RESOLVER RULES

- Precedence: real PortWatch transit > real canal scrape > baseline.
- Escalate-only & ratchet-free: a normal/cleared reading never downgrades a node below its pristine baseline.
- A present real signal is never overridden by the synthetic feed; reassigned via dataclasses.replace so identity lookups stay stable.
- Effect: the two highest-leverage SSI chokepoints — once dark behind a near-always-synthetic scrape — now run on real data.
