

Website Design - Build Prompt

Build Prompt - Ship Tracker Marketing Site (Claude / Claude Design)

Paste everything below the line into Claude (claude.ai -> Artifacts, or Claude Design). It is written to be executed verbatim. It specifies the product, the art direction, the information architecture, every section's copy and layout, the data-visualizations, the motion, the tech, and the quality bar. Build the whole thing; do not summarize or ask clarifying questions - make confident, tasteful decisions where a detail is unspecified.

ROLE & MISSION

You are a senior art director + front-end engineer building the public marketing site for Ship Tracker - Global Shipping Intelligence, an institutional-grade platform that turns real maritime and market data into coverage-tested risk and alpha for shipping-exposed portfolios and supply chains.

Produce a single, self-contained, production-grade React site (one artifact) that looks like it was made by a top studio for a serious quant/maritime firm - think the visual gravity of **The Wall Street Journal** and **FT**, the data rigor of Bloomberg/Palantir/Kpler, and the craft of Stripe - rendered in a nautical, institutional language. It must feel expensive, precise, and trustworthy, never like a generic SaaS template. Every screen should reward a second look.

The site is a showpiece: heavily visual, data-driven, with bespoke charts and restrained, purposeful motion. Default to "more designed," but always in service of clarity and authority - this is for allocators, risk officers, and trading desks, not consumers.

THE PRODUCT (what the site is selling - use these real facts)

Ship Tracker ingests real data feeds - IMF PortWatch chokepoint transits (Suez, Panama, Bab-el-Mandeb, Hormuz, Malacca...), 5-year equity histories for shipping names (ZIM, MATX, SBLK, DAC, CMRE, STNG), FRED macro (Baltic Dry Index, Brent/WTI, DXY, VIX), GDELT geopolitical events, AIS vessel tracks, UN Comtrade flows, marine weather, and OFAC sanctions - and turns them into:

- The Shipping Stress Index (SSI) - a 6-component, prominence-weighted gauge of global shipping stress; the chokepoint component is the single heaviest weight.
 - Coverage-tested risk - Value-at-Risk and Expected-Shortfall that are **statistically validated against realized profit-and-loss**, not just asserted.
- Headline proof: on 1,292 trading days x 6 shipping equities, the standard

Gaussian VaR is statistically rejected at 99% (it under-states the fat tail), while a Student-t tail ($\nu = 6$) passes both 95% and 99%, and its Expected-Shortfall is confirmed well-scaled by the Acerbi-Szekely test.

- Chokepoint intelligence - the two highest-leverage canal nodes (Suez, Panama) driven by *real* PortWatch transit data with a strict precedence ladder.
- An honesty discipline - every figure is labelled real vs modeled; nothing synthetic is ever presented as real. 20 backtest validators run continuously; the suite is exhaustively tested.

Positioning line you may use: "The risk you can actually back-test."

Alternate: "Real data. Coverage-tested. From the chokepoint to the close."

ART DIRECTION - "Nautical Institutional"

The mood board is a brass-and-charcoal nautical chart room crossed with a broadsheet financial paper. Deep water, steel instruments, brass fittings, warm chart paper, and a single disciplined accent.

Palette (use these exact values; this is the spine of the design)

Token	Hex	Use
--ink	#0B1A2B	primary text on light; near-black navy
--hull	#0E2235	darkest sections / hero ground
--navy	#13283D	dark surfaces, footer
--steel	#2E5A7E	primary brand blue (lines, primary UI)
--steel-300	#7FA3C0	secondary blue, muted data series
--mist	#DCE6EF	pale steel wash, light cards on dark
--brass	#B0892F	THE accent - rules, highlights, key numbers
--brass-200	#E7D9B4	brass tint fills, chips
--paper	#F7F5EF	warm paper background (light sections)
--paper-card	#FFFFFF	cards on paper
--rule	#C9D2DB	hairlines on light
--rule-dark	#2A3F54	hairlines on dark
--signal-pos	#2F7D5B	healthy / pass / well-scaled
--signal-neg	#B23A3A	reject / breach / critical
--signal-warn	#C98A21	elevated / caution

Rules: one accent only (brass) - use it sparingly, like gold leaf on an instrument; never fill large areas with it. Backgrounds alternate between deep navy/hull (authority) and warm paper (clarity). Pure white only inside cards. Red/green strictly for risk semantics, never decoration.

Typography

Pair a refined display serif with a precise grotesque and a mono for figures. Use Google Fonts (always load):

- Display / headlines: Fraunces (opsz, slight contrast) - or Newsreader

as fallback. Large, tight tracking, confident. This is the WSJ/FT voice.

- Body / UI: Inter (or Libre Franklin) - clean, neutral, legible.
- Numerals / data / labels / kicker: IBM Plex Mono - tabular, instrument-like.

Use mono for all metrics, axis labels, timestamps, and small-caps kickers.

Scale (desktop): hero display 64-88px; section headlines 36-44px; lead 20-22px; body 16-17px; data labels 12-13px mono uppercase with +0.12em tracking. Generous line-height on body (1.6). Headlines tight (1.05-1.1).

Motifs & texture (this is what makes it "nautical," not generic)

Weave these in subtly and tastefully - they are seasoning, not the meal:

- Bathymetric contour lines (nautical chart depth contours) as faint background line-art in dark sections; thin steel strokes, very low opacity.
- A graticule (latitude/longitude grid) behind the hero and the map.
- Brass hairlines as section dividers and to underline key numbers (a 2px brass rule is the signature accent).
- Depth soundings: scatter small mono numerals like a chart's depth marks in one ambient area.
- A compass rose - minimal, single-weight line - as a small recurring mark (e.g., near the logo, or as a section ornament). Not cartoonish.
- Knot / rope only if extremely subtle (e.g., a thin divider) - when in doubt, leave it out. Avoid clip-art anchors, wheels, sailboats, emoji.

Imagery: no stock photos of cargo ships. Use data-driven and illustrative graphics only - maps, charts, contour art, instrument dials. If you need an "image," generate it as SVG/canvas (a stylized chokepoint map, a depth chart).

Layout system

12-column grid, ~1200-1280px max content width, wide gutters, lots of negative space (institutional = confident whitespace). Strong baseline alignment. Use thin hairline rules to structure content like a broadsheet. Cards have a 1px rule + soft shadow on paper, or a subtle inner border on dark. Corner radius small (4-8px) - crisp, not bubbly.

SIGNATURE VISUAL MOMENTS (build these as real, animated components)

- Hero - "Deep Water." Full-viewport dark --hull ground with a faint animated graticule + bathymetric contours drifting slowly (CSS/canvas, tide-like). Overlaid: a live-style data ticker rail (mono) showing SSI level, chokepoint statuses, and a VaR figure, gently cycling. A minimal world shipping graph (nodes = ports/chokepoints, brass edges = lanes) animates in with a draw-on effect. Headline in Fraunces; one brass rule; a single primary CTA. It should feel like looking at a lit instrument panel at night.

- The Shipping Stress Index gauge. A bespoke radial/arc gauge (SVG) with a brass needle, steel arc, and the 6 components as small segmented contributors beneath. Animate the needle on scroll-into-view. Mono readouts.
- Chokepoint map. A stylized, schematic world map (SVG - not a real tile map) marking Suez, Panama, Bab-el-Mandeb, Hormuz, Malacca with status dots (green/amber/red). On hover, a card shows transit drop % and risk level. A small legend explains the precedence: real PortWatch > real canal scrape > baseline. Graticule behind it.
- The proof chart - VaR/ES calibration. A clean editorial chart (recharts or hand-built SVG) showing breach rate vs nominal at 95% and 99% for Gaussian vs Student-t, with the Gaussian-99% bar flagged red ("REJECTED, $p=0.021$ ") and the Student-t bars green ("PASS"). A companion micro-chart shows realized tail loss vs ES forecast (well-scaled). This is the credibility centerpiece - make it beautiful and unambiguous, annotated like an FT graphic.
- The honesty ledger. A "real vs modeled" visual - e.g., a tally/grid of the 20 validators with 2 marked REAL (brass) and 18 deterministic (steel), all healthy. Editorial, scannable, quietly confident.

Motion across all: restrained and weighty - slow, eased reveals (300-600ms, custom cubic-bezier that feels like settling water), scroll-triggered draw-ons for charts/maps, parallax depth only in the hero. No bouncy springs, no confetti, no gratuitous hover wiggles. Respect prefers-reduced-motion.

INFORMATION ARCHITECTURE (sections, in order)

Build all of these as one long, scroll-driven page with a sticky minimal nav.

- Top nav - left: a small compass-rose mark + "SHIP TRACKER" in mono small-caps with brass dot. Right: anchor links (Platform · Risk Engine · Chokepoints · Methodology) + a brass-outlined "Request access" button. Transparent over the hero, condenses to --navy with a hairline on scroll.
- Hero ("Deep Water") - see signature moment #1.
 - Kicker (mono): INSTITUTIONAL SHIPPING INTELLIGENCE
 - Headline (Fraunces): "The risk you can actually back-test."
 - Sub: "Ship Tracker turns real chokepoint transits, shipping-equity tape, and macro feeds into a stress index and coverage-tested VaR & Expected-Shortfall - validated against realized P&L, labelled real vs modeled, end to end."
 - Primary CTA: "Request access" · Secondary: "See the methodology v"
 - Live ticker rail beneath.
- The thesis - a broadsheet two-column statement. Headline: "Shipping disruption is mispriced risk." Body: a tight, confident paragraph on why chokepoint shocks and freight regimes move shipping equities and supply chains,

and why most "risk numbers" are never tested against what actually happened.

Pull-quote with a brass rule.

- The platform - capability grid. Section headline: "From the chokepoint to the close." A 2x3 (or 3x2) grid of capability cards, each with a tiny bespoke line-icon (SVG, single weight, nautical/instrument flavor) + a mono kicker + headline + one line:
 - Shipping Stress Index · "One number for global shipping stress, decomposed."
 - Coverage-tested risk · "VaR & ES validated against realized P&L."
 - Chokepoint intelligence · "Suez & Panama, live from PortWatch transit."
 - Real-data alpha · "Signals frozen point-in-time, marked net of cost."
 - Disruption event studies · "What real events did to real prices."
 - Honesty by default · "Every figure labelled real vs modeled."
- The Shipping Stress Index - signature moment #2 (the gauge), left; copy right explaining the 6 components and the chokepoint dominance. Mono component readouts.
- Chokepoint intelligence - signature moment #3 (the map), full-bleed dark section with graticule. Side panel explains the precedence ladder and the escalate-only rule. A small inline diagram of transit drop -> risk level (>=50% CRITICAL, >=30% HIGH, >=15% MODERATE).
- Proof - "Tested against what happened." Signature moment #4 (the VaR/ES calibration chart) on warm paper, treated like a featured FT graphic with a headline, a one-sentence dek, the chart, and a 3-bullet "how to read it" caption in mono. This is the section that wins the skeptic.
- Methodology & honesty - signature moment #5 (the validator ledger) + editorial copy: "We label real vs modeled. We back-test. We publish the verdict - even when it's negative." Mention: 20 validators, point-in-time ledger, full test suite. Quiet, credible, no hype.
- A numbers band - a thin full-width strip on --navy with 3-4 big mono stats + brass rules between: e.g., "1,292 days back-tested", "6 shipping equities", "20 live validators", "0 synthetic figures shown as real". Animate counts on view.
- CTA - "Request access." Centered, paper or hull ground, a confident headline, one short line, an access form (email + firm + role) styled as instrument inputs (mono labels, hairline underlines, brass focus). A reassuring institutional note beneath (e.g., "For professional / institutional use. Illustrative; not investment advice.").
- Footer - --navy, bathymetric contour art faint behind. Compass-rose mark + wordmark, a tidy link grid, a thin brass rule, and a small-print disclaimer line: "Ship Tracker is a research & analytics platform. Figures are illustrative and labelled real vs modeled; nothing herein is investment

advice." Latitude/longitude style coordinates as a playful mono ornament.

DATA-VIZ SPEC (build real charts, not images)

Use recharts if available in the artifact env, else hand-build with SVG. Style ALL charts editorially: thin axes, no chartjunk, mono tick labels, hairline grid, direct labels over legends where possible, the brass accent for the "hero" series.

- VaR breach chart: grouped bars, $x = \{95\%, 99\%\}$, series = {Gaussian (steel), Student-t (brass)}; dashed nominal reference lines at 5% and 1%; values: $G95=4.88$, $t95=5.65$, $G99=1.70$, $t99=1.16$; annotate each with its Kupiec p (0.84 / 0.29 / 0.021 / 0.57); outline G99 in --signal-neg with a "REJECTED" tag and t99 with a green "PASS" tag.
- ES calibration micro-chart: paired bars realized vs forecast at 95% and 99% (4.39 vs 4.45; 6.06 vs 6.17), tagged "well-scaled" green.
- SSI gauge: radial arc 0-100 with brass needle; 6 component sub-bars.
- Chokepoint statuses: map dots colored by risk level with hover cards.
- Numbers band counters: animated integer count-ups.

All numbers above are the real platform figures - use them as the example data.

COPY & TONE

Voice: institutional broadsheet - precise, declarative, numerate, quietly confident. Short sentences. No exclamation marks, no emoji, no buzzwords ("revolutionary", "AI-powered", "seamless", "unlock"), no hype. Lead with facts and numbers. Where you assert a capability, ground it in a real figure. Headlines are short and editorial (Fraunces); decks are one sentence; captions are mono. Write all real copy - never lorem ipsum.

TECH & IMPLEMENTATION

- One self-contained React artifact (default export a single App), no external assets beyond Google Fonts and (if available) recharts / framer-motion / lucide-react. If a lib isn't available, hand-build with SVG/CSS.
- Tailwind for layout/spacing; define the palette as CSS variables and map Tailwind to them (or use arbitrary values with the hexes above).
- Motion: framer-motion if available, else CSS @keyframes + IntersectionObserver for scroll reveals. Honor prefers-reduced-motion.
- Responsive: flawless from 360px to 1440px+. The hero, map, and charts must reflow gracefully; stack grids to one column on mobile; keep type legible.
- Accessibility: WCAG AA contrast on every text/background pair (the palette is chosen for this - verify brass-on-dark and steel-on-paper); semantic

landmarks (header/nav/main/section/footer), alt/aria-label on viz, visible focus states (brass ring), keyboard-navigable nav and form.

- Performance: no heavy images; SVG/canvas only; lazy-reveal below the fold; smooth 60fps motion.
 - Polish: consistent 8px spacing rhythm, aligned baselines, no orphaned hairlines, no overflow, no layout shift. Cross-check that the brass accent appears intentionally (a handful of places), not scattered.
-

QUALITY BAR & ANTI-PATTERNS

Aim for "a serious firm paid a great studio for this." Specifically AVOID:

- generic SaaS look: purple/indigo gradients, blob shapes, glassmorphism, big rounded bubbly cards, center-everything hero with a floating screenshot;
- emoji, clip-art nautical icons (anchors/wheels/sailboats), stock cargo photos;
- rainbow chart palettes, 3D charts, chartjunk, drop-shadowed text;
- hypey marketing copy, lorem ipsum, fake logos "as seen in";
- motion for motion's sake (bouncy springs, parallax everywhere, autoplay video).

Instead deliver: disciplined nautical-institutional design, broadsheet typographic hierarchy, bespoke editorial data-viz, restrained brass accenting, weighty tasteful motion, and copy that reads like it was written by a quant who can write.

Build the complete site now as one artifact. Make every decision in service of authority, clarity, and craft.
